

Chapman Apr Feb 5/80

Dear Doctor

Here is a request that I have had a long time in a quandary what to do with it. Of course I can't respond although I would like to. So I conclude to send it to you in the hope that some of the young botanists around your table well posted in matters desired by the Dr will take the matter in hand. I commend the letter to you. At odd moments I am looking over your Flora & when a *Scutellaria* that I have in cultivation blooms I will send you a sample to see if it is not your *S. brevifolia*. It is my *S. integrifolia* - major which Feay was always scolding that I did not make a species of. Best regards to Mrs Gray & yours always

A W Chapman

I don't know in the present
of the situation of the world
and the state of the mind
of the people, the only way
to prevent the spread of
the disease is to keep
the people as much as possible
from coming together in
large numbers. This can be
done by closing the schools
and the public places, and
by advising the people to
stay at home. It is also
important to keep the people
from touching the sick
and from touching the things
which they have touched.
It is also important to keep
the sick in their beds and
to keep the things which they
have touched clean and
disinfected. It is also
important to keep the people
from going to the public
houses and to the public
places. It is also important
to keep the people from
going to the markets and
to the shops. It is also
important to keep the people
from going to the streets
and to the squares. It is
also important to keep the
people from going to the
churches and to the public
houses. It is also important
to keep the people from
going to the public places
and to the public houses.
